

ContentLinksSM Filter Tags (explicit “do NOT mark area” tags)

Filter tags are used in order to define an area on the page where ContentLinks should not appear. All other areas on the page are valid mark areas. Please use these tags with caution in order to prevent a situation where large areas are filtered unintentionally.

Open tag: ``

Closing tag: ``

You want ContentLinks to appear everywhere on the page EXCEPT in this area.

Example:

Due to previous experience, I will even highlight it this way, in the normal text. READ THE GREEN BOX BELOW! This is not a review, this is an absolutely subjective preview!!! If somebody writes to me in a chat room or private message or anywhere else that this “review” is somehow strange/subjective/lacking detail or something similar, I will personally go and perform a device hard reset for him, chew up his [SD card](#) and break his stylus!

Notice: This article is not a review. The featured device was not subject to my typically thorough testing and pedantic detection of weak points. These are my first, positive, impressions. This is not therefore an objective report, but a wholly subjective description of a brand new device, which is full of uncritical admiration and enthusiasm for the new functions and properties. If you do not like this format for some reason, then wait for the full review.

Well, my somewhat unconventional introduction is over. For those who did not collapse and did not spend the last of their pocket money at their favourite psychoanalyst’s after reading the two preceding paragraphs, I have a very interesting Pocket PC here. All that I have written in the introduction is definitely true. What’s more, because of the limited length of the introduction, I have held back a few things yet; the HTC Hermes can do even more! One thing at a time, though.

You need to place the open and closing tags around the selected area as described below:

Due to previous experience, I will even highlight it this way, in the normal text. READ THE GREEN BOX BELOW! This is not a review, this is an absolutely subjective preview!!! All that I have written in the introduction is definitely true. What’s more, because of the limited length of the introduction, I have held back a few things yet; the HTC Hermes can do even more! One thing at a time, though.

Place the open filter tag in front of the “filter area” and the closing filter tag at the end of the “filter area”.

Kontera

CREATING **IN-TEXT** RELEVANCE

In the HTML code, it will look as follows:

Open tag

```
<span name="KonaFilter">  
<P CLASS="comment">Notice: This article is not a review.  
</span>
```

Closing tag
